

Assignment: Adding health checks to your microservices

In this assignment you will add health checks to all your microservices.

Add the health checks

For the Catalog, Inventory and Trading microservices:

1. Bump the Play.Common package reference version in the service project to the latest version you published in the previous lesson.
2. Update the ConfigureServices method in Startup to add the health check services, including the MongoDB health check.
3. Update the Configure method in Startup to map the Play Economy health check endpoints.
4. Test the health endpoints of the microservice in Postman to confirm they work properly
 - ❖ The Identity microservice needs to be up and running for you to be able to test the health endpoints in any of the microservices.
5. Commit and push.
