

Installing the Azure CLI

We will be mostly managing our Azure cloud resources from the command line, so that we can easily keep track of every Azure command used to create or manage cloud resources in our README files.

For this we are going to need the Azure Command Line Interface, or Azure CLI. So, let's go ahead and install it in our dev box.

Demo Prep

- Remove any Azure CLI extensions
- Uninstall Azure CLI
- Remove %USERPROFILE%\azure

In the browser

1. Browse to <https://aka.ms/install-azure-cli>
2. Click on installer link
3. Go through wizard

In Play.Infra repo

4. Open Terminal
5. Check the version:
az --version

In the next lesson you will start using the Azure CLI to create your first Azure resource group.
