

Creating an Azure resource group

A resource group is a container that holds resources that have some sort of relationship in your Azure based application or system. In the end, every resource you create in Azure must exist within a resource group, so let's go ahead and create the one that we will be using for our Play Economy system.

In Play.Infra repo

1. Open Terminal
2. Login to Azure:
`az login`
3. Set Azure subscription:
`az account set --subscription ".NET Microservices"`
4. Update README:

```
## Creating the Azure resource group
```powershell
$appname="playeconomy"
az group create --name $appname --location eastus
```
```
5. Run the commands
6. Commit and push changes

In the next module you will start creating the Azure resources needed by your microservices.
