

Adding Cosmos DB support to the Common library

Let's update our Common library to add support to connect to our new Cosmos DB account.

In [Play.Common repo](#)

1. Show the Connection String section of the DB in Azure Portal.
2. Update MongoDBSettings.cs:

```
public class MongoDbSettings
{
    private string connectionString;

    public string Host { get; init; }

    public int Port { get; init; }

    public string ConnectionString
    {
        get { return string.IsNullOrEmpty(connectionString) ? $"mongodb://{Host}:{Port}" :
connectionString; }
        init { connectionString = value; }
    }
}
```

3. Update README with new NuGet package version to create Version 1.0.7
4. Create and publish the new NuGet package version
5. Commit and push

In the next lesson you will update the Identity microservice to take advantage of this updated library.
