

Generating a GitHub Personal Access Token

Personal access tokens are an alternative to using passwords for authentication to GitHub. You will need a personal access token to publish your NuGet packages to GitHub packages, so let's create one now.

In GitHub

1. Navigate to <https://github.com/settings/profile>
2. Go to Developer Settings → Personal access tokens
3. Click Generate new token
4. Configure token:

Note: NuGet

Scope: write:packages

5. Click Generate token
6. Copy the token to a notepad

In the next lesson you will use this new token to publish packages to GitHub.
