Creating an Azure Container Registry

Let's create an Azure Container Registry to store all of the Docker images we have created so far and that later we will deploy to a Production environment.

Demo prep

- Ensure playeconomy ACR doesn't already exist

In Play.Infra repo

1. Update README:

   ## Creating the container registry
   ```powershell
   az acr create --name $appname --resource-group $appname --sku Basic
   ```

2. Run the command

3. Show the created registry in Azure portal

4. Commit and push.

With the ACR ready, in the next lesson you will learn how to publish your first Docker image to your new container registry.
