Assignment: Publishing Docker images to Azure Container Registry

In this assignment you will publish the Docker images for the Catalog, Inventory and Trading microservices to your Azure Container Registry (ACR).

Publish the docker images

For each microservice:

1. Update the README file replacing the tag in the **docker build** command with a tag that uses your ACR login server as the prefix

2. Rebuild the latest version of your Docker image using the new docker build command
   ❖ This will also generate the new tag prefixed with your ACR login server

3. Update the README file by adding instructions to login to your ACR and push the Docker image

4. Push the just built docker image to ACR

5. Verify the docker image shows up in the Azure Portal

6. Commit and push all changes
